| Target version: | | | Spent time: | 1.00 hour |

**Description**

We have the diagram that we have completed.

Now let's generate codes from it. (Review Week09 assignments)

I think that the UML diagram is not totally correct and you must find some issues.

You should regenerate the diagram from the generated code and compare it with the original one.

Then check if it's what you expect and there is anything to fix.

For example, don't you forget *init*()? and, this must have parameters to initialize with some values.

generate many times and fix it !

put your spent time every time after you work.

make this issue "resolved" after you finish it.

---
